

Test Result Interpretation — Assessment

v0 deterministic spine — no model interpretation in this phase

Date	2026-08-05
Commit	2f8da75c9901
Branch	claude/reste-agent-spec-review-1bfc23
Test outcome	PASS
Reviewer attention required	NO

Summary

12157 tests: 12142 passed, 0 failed, 15 skipped. Overall line coverage 99.10%. This is a deterministic v0 report — figures are transcribed from the runner artefacts, not interpreted. Whether any change here is a regression, an intended expectation change, or a documentation divergence is out of scope until v1/v2 (see Uncertainties).

Test outcome

All 12142 executed tests passed; no failures to interpret.

Coverage

v0 has no stored baseline, so this is not a delta — it lists the lowest-covered packages as a standing snapshot. Coverage figures on Python 3.13.1 may be deflated by a sys.monitoring tracer defect; treat swings with caution (see Uncertainties).

Package	Coverage %	Lines
port.rand.mekong.commercial.commercial_random	0.0	0/3
port.rand.mekong.gauge	57.1	4/7
port.rand.mekong.property	76.9	10/13
visual.core.visualizer	89.2	198/222
visual.interactivity.property.loanpricer	93.8	15/16
port.cdm.asset.loan	94.2	82/87
models.schedule	95.2	40/42
port.src.gauge.synthetic	96.0	48/50
port.rand.shared.property.property_random	96.5	55/57
routes.propertyts.core_storms	96.5	84/87
port.src.book.book_common	96.9	94/97
routes.commercial.portfolio	97.0	129/133
port.src.property.ts	97.1	99/102
routes.propertyts	97.2	825/849
port.src.property.hc	97.3	72/74

Showing 15 of 80 packages below threshold (lowest first); 65 not shown.

Audit findings

Deferred. `full_audit` currently emits a human PDF, not a machine-readable finding set; a structured (JSON) output mode is the v0 prerequisite for this section. See `full_audit_report.pdf` in this directory for the current audit.

Documentation divergence

Deferred to v2. This section requires read access to the model documentation tree and a model to judge divergence; it is the highest-value and highest-risk section and ships last.

Uncertainties

- v0 is deterministic: it does not judge whether a failure is a regression or an intended expectation change.
- No baseline coverage delta is computed in v0; the Coverage section is a snapshot, not a change.
- Documentation divergence is deferred to v2 (no docs access at v0).
- Audit findings await a structured `full_audit` output mode.
- Coverage may be under-reported on Python 3.13.1 (sys.monitoring tracer defect); a large swing not localised to changed files is an environment signal, not a finding.
